

It's Easy to Support the Truth

- The landfill recycling revolution has begun - leaving behind no waste •
- There are three plastic recycling methodologies that don't work •
- Another recycling bust - consumers *don't want recycled clothes* •

With so Much Good to Proclaim, Let's not Dwell on Past Missteps

RNG Plastics are Landfill-Safe. They will make an enormous *positive impact* on the environment and mankind for centuries to come *without leaving behind waste plastics*. It's a simple truth to grasp - a cost effective one to execute. Simply stated:

RNG Plastics are a safe, healthy solution to the future of plastics - all of them!

RNG Plastics use natural supplements that enable recovery (aka recycling) in EPA regulated landfills: Landfill Methane Outreach Program (LMOP) | US EPA. They leave behind no toxic residues, no microplastic, negligible GhG and are turnkey to get started.

- Today the recycle rate is over 85%.
- By 2035 the recycled rate soars to 95%.
- By 2050 the recycle rate is over 99%!

The revolution has begun. Not only in the United States, but its spreading into China, Canada, and soon into Australia.

As Lee Iacocca once said, "*Lead, follow, or get out of the way*". Which one describes you?

Past Missteps: Three Recycling Methods that Must Be Fixed

Disturbing Facts about Mechanical, Chemical Recycling and Composting

We agree with plastics experts, like Karen Laird, editor of *Sustainable Packaging News*, who says, "The recycling trade needs to get fixed. It's not working".

Fact: 90% of plastics cannot be mechanically recycled (APR rules):

- No food, dirt, chemical contamination.
- No plastic/paper laminations, mixed, dissimilar plastics.
- NO excessive adhesives and large labels allowed
- No small pieces (lid security, labels).

Fact: Chemical recycling is bad /toxic for the environment:

- Limited outputs use excessive energy.
- Banned in several states due to severe contamination issues.
- Several chemical recyclers have shut down.

Fact: Bioplastics are ONLY recycled into GhG:

- Rarely, if ever, composted.
- Contamination issues have shut down curbside pick-up in 20+ states (California, Oregon, Washington, Colorado, etc.).
- Produces 1.2 tons of waste for every 1 ton of PLA.
- Not considered a sustainable farming practice.

Only RNG Plastics are safely landfill recycled at an 85%+ rate!

Another Plastic Waste Bust

This Startup Promised to Help Fashion Go Green

But - no one wanted it. Who wants to wear clothes made from materials that were filthy, recyclers didn't want it? It came from contaminated outlets and foreign waste processors who couldn't do anything with it.
